

Fitness Buddy

Problem Statement

The Challenge

Maintaining a healthy lifestyle has become increasingly difficult due to busy schedules, lack of personalized fitness guidance, inconsistent motivation, and limited access to professional health advice. Many existing fitness applications require expensive subscriptions, rigid workout plans, or generic recommendations that fail to adapt to individual goals, dietary preferences, and daily routines.

Users need an intelligent, accessible, and AI-powered virtual fitness assistant that can provide personalized workout recommendations, nutrition guidance, health assessments, and continuous motivation anytime and anywhere.

The Objective

Develop an AI-powered Fitness Buddy that provides personalized fitness coaching and health guidance using IBM watsonx.ai and Granite Foundation Models. The solution should include the following core capabilities:

Personalized Workout Plans

Generate customized workout routines based on fitness goals, experience level, available equipment, and daily schedule.

AI Nutrition Planner

Recommend healthy meal plans according to dietary preferences, calorie requirements, allergies, fitness goals, and user-defined food budget.

BMI & Health Assessment

Calculate BMI and provide personalized health insights, risk analysis, and fitness recommendations.

AI Fitness Coach

Answer health and fitness queries conversationally while providing motivational guidance and personalized suggestions.

Progress Monitoring

Track workouts, calories, hydration, BMI, and overall fitness progress through interactive dashboards.

Lifestyle Recommendations

Encourage healthy habits, hydration, sleep management, recovery techniques, and long-term fitness consistency.
